

Amendments to the Specification

Please make the following amendments to the abstract of the disclosure.

ABSTRACT OF THE DISCLOSURE

[0075] A tracking solar collector assembly includes Southside supports, North side supports and support structures. Each support structure has pivotal support points defining a tilt axis and ~~has supports~~ at least one solar collector mounted thereto. First support points of first and second support structures are pivotally connected to first and second Southside supports. A second support point of the first support structure is pivotally connected to first and second North side supports. A second support point of the second support structure is pivotally connected to second and third North side supports. ~~The assembly further includes a~~ A tilting assembly causing causes the solar collector support structures and the solar collectors ~~therewith to tilt in unison. Another aspect of the invention is directed to~~ A tracking solar collector of the type comprising may comprise a torsion tube mounted ~~for rotation~~ rotatable about a torsion tube axis; ~~the improvement comprises~~ with mounting structure ~~securing the solar panels secured to the torsion tube at an chosen angle to the torsion tube axis with each of the solar panels located entirely vertically above the torsion tube axis when the torsion tube is at the noontime angular orientation.~~
